Subject: WHO JMPR Glyphosate summary

FYI

A summary of the JMPR report has been published online and concludes that glyphosate is unlikely to pose a cancer risk to humans through the diet. The summary is available here:

<http://www.who.int/foodsafety/jmprsummary2016.pdf?ua=1>

In view of the absence of carcinogenic potential in rodents at human-relevant doses and the absence of genotoxicity by the oral route in mammals, and considering the epidemiological evidence from occupational exposures, the Meeting concluded that glyphosate is unlikely to pose a carcinogenic risk to humans from exposure through the diet. The Meeting reaffirmed the group ADI for the sum of glyphosate and its metabolites of 0–1 mg/kg body weight on the basis of effects on the salivary gland. The Meeting concluded that it was not necessary to establish an ARfD for glyphosate or its metabolites in view of its low acute toxicity.
